TECHNOLOGY INNOVATION

BACKGROUND OF THE INVENTION

In rotary drilling of subterranean wells numerous functions and characteristics are expected of a drilling fluid. A drilling fluid should circulate throughout the well and carry cuttings from beneath the bit, transport the cuttings up the annulus, and allow their separation at the surface. At the same time, the drilling fluid is expected to cool and clean the drill bit, reduce friction between the drill string and the sides of the hole, and maintain stability in the borehole's uncased sections. The drilling fluid should also form a thin, low permeability filter cake that seals openings in formations penetrated by the bit and act to reduce the unwanted influx of formation fluids from permeable rocks.

Drilling fluids are typically classified according to their base material. In oil base fluids, solid particles are suspended in oil, and water or brine may be emulsified with the oil. The oil is typically the continuous phase. In water base fluids, solid particles are suspended in water or brine, and oil may be emulsified in the water. The water is typically the continuous phase. Pneumatic fluids are a third class of drilling fluids in which a high velocity stream of air or natural gas removes drill cuttings.

Invert emulsion fluids, i.e. emulsions in which the non-oleaginous fluid is the discontinuous phase and the oleaginous fluid is the continuous phase, are employed in drilling processes for the development of oil or gas sources, as well as, in geothermal drilling, water drilling, geoscientific drilling and mine drilling. Specifically, the invert emulsion fluids are conventionally utilized for such purposes as providing stability to the drilled hole, forming a thin filter cake, lubricating the drilling bore and the downhole area and assembly, and penetrating salt beds without sloughing or enlargement of the drilled hole.

Oil-based drilling fluids are generally used in the form of invert emulsion muds. An invert emulsion mud consists of three-phases: an oleaginous phase, a non-oleaginous phase and a finely divided particle phase. Also typically included are emulsifiers and emulsifier systems, weighting agents, fluid loss additives, viscosity regulators and the like, for stabilizing the system as a whole and for establishing the desired performance properties. Full particulars can be found, for example, in the article by P. A. Boyd et al entitled "New Base Oil Used in Low-Toxicity Oil Muds" in the Journal of Petroleum

TOP SECRET//SI//NOFORN

1 Technology, 1985, 137 to 142 and in the Article by R. B. Bennet entitled "New Drilling
2 Fluid Technology-Mineral Oil Mud" in Journal of Petroleum Technology, 1984, 975 to
3 981 and the literature cited therein. Also reference is made to the description of invert
4 emulsions found in Composition and Properties of Drilling and Completion Fluids, 5th
5 Edition, H. C. H. Darley, George R. Gray, Gulf Publishing Company, 1988, pp. 328-332,
6 the contents of which are hereby incorporated by reference.

7 The emulsifying agent component of the invert emulsion drilling fluid serves to
8 lower the interfacial tension of the liquids so that the non-oleaginous liquid may form a
9 stable dispersion of fine droplets in the oleaginous liquid. As used herein, emulsifying
10 agent and surfactant are used interchangeably. Typically emulsifying agents are chemical
11 compounds that are polar on one portion of the molecule and non-polar on another area.
12 Such characteristics allow the emulsifying agent to be slightly soluble in both the
13 oleaginous phase and the non-oleaginous phase and thus found at the interfacial surfaces
14 between the two. Because of the unique characteristics of such compounds, the
15 biodegradability is limited. In some cases, the surfactant molecules are toxic to the
16 biodegrading organism.

17 As a result of the above, there remains and exists an unmet need for a surfactant
18 package that can be used to formulate invert emulsion drilling fluids and yet remain
19 biodegradable.

20

SUMMARY OF THE INVENTION

21

22 The present invention is generally directed to an invert emulsion drilling fluid that
23 is formulated using a biodegradable surfactant. As disclosed below, such a fluid
24 includes: an oleaginous continuous phase, a non-oleaginous discontinuous phase, a
25 surfactant that is a fatty acid ester of diglycerol or triglycerol, and a weighting agent. In
26 one such illustrative embodiment, the surfactant is a di-fatty acid ester of diglycerol in
27 which the fatty acid has the formula RCO_2H and R is an alkyl or alkenyl having 10 to 20
28 carbon atoms. Alternatively, the surfactant is a di-fatty acid ester of triglycerol in which
29 the fatty acid has the formula RCO_2H and the R is an alkyl or alkenyl having 10 to 20
30 carbon atoms. More preferably the surfactant is selected from polyglyceryl-2

*Sub
c7*

1 diisostearate or polyglyceryl-3 diisostearate or mixtures and combinations of these. One
2 of skill in the art should appreciate that the oleaginous fluid may be selected from a wide
3 variety of suitable materials. Examples include: diesel oil, mineral oil, synthetic oil, ester
4 oils, glycerides of fatty acids, aliphatic esters, aliphatic ethers, aliphatic acetals, or other
5 such hydrocarbons and combinations and mixtures of these and similar fluids. In a
6 similar manner, the non-oleaginous phase may be selected from a wide variety of suitable
7 materials. Examples of which include: fresh water, sea water, brine, aqueous solutions
8 containing water soluble organic salts, water soluble alcohols or water soluble glycols or
9 combinations and mixtures of these and similar fluids. The weighting agent component
10 of such an illustrative drilling fluid can be either a water-soluble weighting agent or a
11 water insoluble weighting agent or combinations and mixtures of these two. In one
12 illustrative embodiment, the water insoluble weighting agent is selected from barite,
13 calcite, mullite, gallena, manganese oxides, iron oxides, or combinations and mixtures of
14 these and similar solid materials used to weight drilling fluids. In another illustrative
15 embodiment, the water soluble weighting agent is selected from water soluble salts of
16 zinc, iron, barium, calcium or combinations and mixtures of these in aqueous solutions
17 used to add weight to drilling fluids.

18 Also encompassed by the present invention are the methods of formulating such
19 fluids and using such fluids in the drilling of subterranean wells. For example in one such
20 embodiment, a drilling fluid as described below is formulated, circulated in a rotary
21 drilling drill string and utilized as the drilling fluid in drilling a well.

22 These and other features of the present invention are more fully set forth in the
23 following description of preferred or illustrative embodiments of the invention.

24

25 **DESCRIPTION OF ILLUSTRATIVE EMBODIMENTS**

26 The present invention is generally directed to invert emulsion drilling fluids and
27 their use in the drilling of subterranean wells. The invert emulsion fluids of the present
28 invention generally are composed of an oleaginous continuous phase, a non-oleaginous
29 discontinuous phase, a surfactant that is a fatty acid ester of diglycerol or triglycerol, and
30 a weighting agent.

1 As used herein the term "oleaginous liquid" means oil which is a liquid at 25°C
2 and immiscible with water. Oleaginous liquids typically include substances such as
3 diesel oil, mineral oil, synthetic oil such as polyolefins or isomerized polyolefins, ester
4 oils, glycerides of fatty acids, aliphatic esters, aliphatic ethers, aliphatic acetals, or other
5 such hydrocarbons and combinations of these fluids. In one illustrative embodiment of
6 this invention the oleaginous liquid is an polyolefin material which provides
7 environmental degradability to the overall drilling fluid. Such polyolefins should be
8 selected such that the molecular weight permits for a functional invert emulsion drilling
9 fluid to be formulated. Especially preferred are isomerized polyolefins having a carbon
10 backbone of 16 to 18 carbons and in which at least one point of unsaturation is internal.

11 The amount of oleaginous liquid in the invert emulsion fluid may vary depending
12 upon the particular oleaginous fluid used, the particular non-oleaginous fluid used, and
13 the particular application in which the invert emulsion fluid is to be employed. However,
14 generally the amount of oleaginous liquid must be sufficient to form a stable emulsion
15 when utilized as the continuous phase. Typically, the amount of oleaginous liquid is at
16 least about 30, preferably at least about 40, more preferably at least about 50 percent by
17 volume of the total fluid.

18 As used herein, the term "non-oleaginous liquid" mean any substance which is a
19 liquid at 25°C and which is not an oleaginous liquid as defined above. Non-oleaginous
20 liquids are immiscible with oleaginous liquids but capable of forming emulsions
21 therewith. Typical non-oleaginous liquids include aqueous substances such as fresh
22 water, seawater, brine containing inorganic or organic dissolved salts, aqueous solutions
23 containing water-miscible organic compounds and mixtures of these. In one illustrative
24 embodiment the non-oleaginous fluid is brine solution including inorganic salts such as
25 calcium halide salts, zinc halide salts, alkali metal halide salts and the like.

26 The amount of non-oleaginous liquid in the invert emulsion fluid may vary
27 depending upon the particular non-oleaginous fluid used and the particular application in
28 which the invert emulsion fluid is to be employed. Typically, the amount of non-
29 oleaginous liquid is at least about 1, preferably at least about 3, more preferably at least
30 about 5 percent by volume of the total fluid. Correspondingly, the amount should not be

1 so great that it cannot be dispersed in the oleaginous phase. Therefore, typically the
2 amount of non-oleaginous liquid is less than about 90, preferably less than about 80,
3 more preferably less than about 70 percent by volume of the total fluid.

4 As the term is used herein, "surfactant" and "emulsifier" or "emulsifying agent"
5 are used interchangeably to indicate that component of the invert emulsion drilling fluid
6 that stabilizes the invert emulsion. One of ordinary skill in the art should appreciate that
7 such a compound acts at the interface of the oleaginous and the non-oleaginous fluids and
8 lowers the differences in surface tension between the two layers. In the present invention
9 it is important that the emulsifying agent does not adversely affect the biodegradability of
10 the invert emulsion. The ability of any particular emulsifying agent to stabilize the invert
11 emulsion can be tested by using the invert emulsion test disclosed below. In addition if
12 the emulsifying agent is to be useful in the formulation of a drilling fluid, the emulsifier
13 should be thermally stable. That is to say, the emulsifier must not break down or
14 chemically degrade upon heating to temperatures typically found in a downhole
15 environment. This may be tested by heat aging the emulsifier as is done in the Examples.

16 Typically prior art emulsion compounds are difficult or are very slow to
17 biodegrade. However, it has been found that fatty acid esters of diglycerol or triglycerol
18 function as surfactants that are readily biodegradable. In one preferred embodiment of the
19 present invention, the surfactant is a di-fatty acid ester of diglycerol in which the fatty
20 acid has the formula RCO_2H and the R is an alkyl or alkenyl having 10 to 20 carbon
21 atoms. Alternatively, the surfactant is a di-fatty acid ester of triglycerol in which the fatty
22 acid has the formula RCO_2H and the R is an alkyl or alkenyl having 10 to 20 carbon
23 atoms. As illustrated in the examples below, it is especially preferred that the surfactant
24 is a polyglyceryl-2 diisostearate or polyglyceryl-3 diisostearate or mixtures of these. A
25 suitable emulsifier within the scope of the present invention should be capable of
26 stabilizing the invert emulsion under conditions of heat aging. The amount of the
27 emulsifier needed to form a stable invert emulsion can be determined by systematically
28 adjusting the amount of emulsifier added and testing the stability of the fluid. Preferably
29 the amount of emulsifier should be from about 1 to about 20 pounds per barrel (ppb) and
30 more preferably from about 8 to about 12 ppb of the drilling fluid.

TOP SECRET//EYES ONLY

1 The invert emulsion drilling fluids preferably contain weight materials. The
2 quantity and nature of the weight material depends upon the desired density and viscosity
3 of the final composition. The preferred weight materials include, but are not limited to,
4 barite, calcite, mullite, gallena, manganese oxides, iron oxides, mixtures of these and the
5 like. The weight material is typically added in order to obtain a drilling fluid density of
6 less than about 24, preferably less than about 21, and most preferably less than about 19.5
7 pounds per gallon.

8 Viscosifying agents, for example, organophilic clays, may optionally be
9 employed in the invert drilling fluid compositions of the present invention. Usually,
10 other viscosifying agents, such as oil soluble polymers, polyamide resins, polycarboxylic
11 acids and fatty acid soaps may also be employed. The amount of viscosifying agent used
12 in the composition will necessarily vary depending upon the end use of the composition.
13 Usually such viscosifying agents are employed in an amount which is at least about 0.1,
14 preferably at least about 2, more preferably at least about 5 percent by weight to volume
15 of the total fluid. VG-69™ and VG-PLUS™ are organoclay materials and Versa HRPTM
16 is a polyamide resin material manufactured and distributed by M-I L.L.C. which are
17 suitable viscosifying agents.

18 Fluid loss control agents such as modified lignite, polymers, oxidized asphalt and
19 gilsonite may also be added to the invert drilling fluids of this invention. Usually such
20 fluid loss control agents are employed in an amount, which is at least about 0.1,
21 preferably at least about 1, more preferably at least about 5 percent, by weight to volume
22 of the total fluid.

23 One skilled in the art may readily identify using the following test if he has used
24 the appropriate ingredients and amounts to form an invert emulsion:

25 INVERT EMULSION TEST: A small portion of the emulsion is placed in a beaker
26 which contains an oleaginous fluid. If the emulsion is an invert emulsion, the small
27 portion of the emulsion will disperse in the oleaginous fluid. Visual inspection will
28 determine if it has so dispersed.

29 Alternatively, the electrical stability of the invert emulsion may be tested using a
30 typical emulsion stability tester. Generally the voltage applied across two electrodes is

1 increased until the emulsion breaks and a surge of current flows between the two
2 electrodes. The voltage required to break the emulsion is a common measure of the
3 stability of such an emulsion. Other tests are described on page 166 of the book,
4 Composition and Properties of Drilling and Completion Fluids, 5th Edition, H. C. H.
5 Darley and George Gray, Gulf Publishing Company, 1988, the contents of which are
6 hereby incorporated by reference.

7 The following examples are included to demonstrate preferred embodiments of
8 the invention. It should be appreciated by those of skill in the art that the techniques
9 disclosed in the examples which follow represent techniques discovered by the inventors
10 to function well in the practice of the invention, and thus can be considered to constitute
11 preferred modes for its practice. However, those of skill in the art should, in light of the
12 present disclosure, appreciate that many changes can be made in the specific
13 embodiments which are disclosed and still obtain a like or similar result without
14 departing from the scope of the invention.

15 The following examples are submitted for the purpose of illustrating the
16 performance characteristics of the drilling fluid compositions of this invention. These
17 tests were conducted substantially in accordance with the procedures in API Bulletin RP
18 13B-2, 1990 which is incorporated herein by reference. The following abbreviations may
19 be used in describing the results of experimentation:

20 "E.S." is electrical stability of the emulsion as measured by the test described in
21 Composition and Properties of Drilling and Completion Fluids, 5th Edition, H. C. H.
22 Darley, George R. Gray, Gulf Publishing Company, 1988, pp. 116, the contents of which
23 are hereby incorporated by reference. Generally, the higher the number, the more stable
24 the emulsion.

25 "PV" is plastic viscosity that is one variable used in the calculation of viscosity
26 characteristics of a drilling fluid, measured in centipoise (cP) units.

27 "YP" is yield point that is another variable used in the calculation of viscosity
28 characteristics of drilling fluids, measured in pounds per 100 square feet (lb/100ft²).

29 "AV" is apparent viscosity that is another variable used in the calculation of
30 viscosity characteristic of drilling fluid, measured in centipoise (cP) units.

1 "GELS" is a measure of the suspending characteristics, or the thixotropic
2 properties of a drilling fluid, measured in pounds per 100 square feet (lb/100 ft²).

3 "API F.L." is the term used for API filtrate loss in milliliters (ml).

4 "HTHP" is the term used for high temperature high pressure fluid loss at 200°F,
5 measured in milliliters (ml) according to API bulletin RP 13 B-2, 1990.

6 As used in the formulation of the drilling fluids illustrated in the following
7 example the following component names are intended to mean the following:

8 IO C₁₆₋₁₈ is a isomerized olefin used as a synthetic based drilling fluid available
9 commercially as Amodril-1000 from Amoco Co.

10 Bio Base-300 is a mixture of blended linear parafin (93%) and olefin available
11 commercially from Shrieve Chemicals Co.

12 BENTONE 38 is an organophilic clay viscosifying agent available commercially
13 from M-I LLC of Houston, Texas.

14 MI Bar is a barite based weighting agent available commercially from M-I LLC
15 of Houston Texas.

16 Emulpharma PG20 is a emulsifier available commercially from RES Pharma of
17 Italy.

18 VERSAWET is a wetting agent available commercially from M-I LLC of
19 Houston Texas.

20 VERSAVERT F is a fluid loss control agent available commercially from M-I
21 LLC of Houston Texas.

22 VERSA SWA is a wetting agent available commercially from M-I LLC of
23 Houston Texas.

24 VERSAMOD is a LSRV agent available commercially from M-I LLC of Houston
25 Texas.

26 BENTONE (EMI 155), is a viscosifier available from M-I LLC of Houston
27 Texas..

28 ARM 1-73A is a choline chloride emulsifier available commercially from Special
29 Product Co. of Houston, Texas.

1 Ecotrol (EMI-526) is a fluid loss control agent available commercially from M-I
2 LLC of Houston, Texas

3 VG PLUS is a viscosifier available commercially from M-I LLC of Houston
4 Texas.

5 NOVA PLUS is a synthetic mud system available commercially from M-I LLC of
6 Houston Texas.

7 NOVAMUL is a emulsifing agent used with the NOVA PLUS system available
8 commercially from M-I LLC of Houston Texas.

9 NOVAWET is a wetting agent used with the NOVA PLUS system available
10 commercially from M-I LLC of Houston Texas.

11 VERSACOAT is a primary emulsifing agent available commercially from M-I
12 LLC of Houston Texas.

13 Lime is commercially acceptable grade of calcium hydroxide commonly
14 available.

15 CaCl₂ (95%), is an aqueous calcium chloride solution having 95% by weight
16 calcium choride.

17 REV DUST is a simulated drill cuttings material available from M-I LLC of
18 Houston, Texas.

19 Class G Cement is a Portland cement formulated for use in cementing
20 subterranean wells that is commercially available.

21 Zechstein brine is an aqueous brine solution containing 50% w/v magnesium
22 chloride, 0.038 w/v potassium chloride; 0.026 w/v sodium chloride; 0.63 v/v deionized
23 water.

24 All values associated with the formulations described below are grams unless
25 otherwise specified.

26

27 Example 1. Drilling Fluid with 25% CaCl₂ Brine

28 A drilling fluid of the present invention was formulated to contain the following:

Fluid Formulation	A
IO C ₁₆₋₁₈ , g	173.7
BENTONE 38, g	7.0
Lime, g	2.0
Emulpharma PG20, g	8.0
Tapwater, g	54.3
CaCl ₂ (95%), g	18.1
CaCO ₃ , g	35
MI Bar, g	208.9

1

2 The formulated fluid had a mud weight of about 11.8 ppg. The initial properties
 3 of the fluid were measured and then the fluid was aged at 200 °F for 16 hours with
 4 rolling. Rheology of the initial fluid and the aged fluid were measured at 120 °F.

5 Representative data is given below:

Fluid Properties	Initial	Aged
600 rpm Rheology	65	73
300 rpm Rheology	42	49

9

TOP SECRET - DTG 22680

1 The formulated fluid had a mud weight of about 11.8 ppg. The initial properties
 2 of the fluid were measured and then the fluid was aged at 300 °F shown for 16 hours with
 3 rolling. Rheology of the initial fluid and the aged fluid were measured at 120 °F.
 4 Representative data is given below:

Fluid Formulation	H		I		J	
Fluid Properties	Initial	Aged	Initial	Aged	Initial	Aged

10 min, Gel, lb/100 t ²	8	29	10	35
HTHP @ 250°F, cc/30	-	7.0	-	1.2
ES @ 120°F, Volts	347	681	677	1617

5
6 Upon review of the above data, one of ordinary skill in the art should appreciate
7 that the above-formulated fluids are useful as an invert emulsion drilling fluids. It should
8 also be noted that decreasing the concentration of the clay lowered rheology, formulation
9 GG.

10 In view of the above disclosure, one of ordinary skill in the art should understand
11 and appreciate that one illustrative embodiment of the present invention includes an
12 invert emulsion drilling fluid that is formulated to include: an oleaginous continuous
13 phase, a non-oleaginous discontinuous phase a surfactant that is a fatty acid ester of
14 diglycerol or triglycerol, and a weighting agent. In one such illustrative embodiment, the
15 surfactant is a di-fatty acid ester of diglycerol in which the fatty acid has the formula
16 RCO₂H and the R is an alkyl or alkenyl having 10 to 20 carbon atoms. Alternatively, the
17 surfactant is a di-fatty acid ester of triglycerol in which the fatty acid has the formula
18 RCO₂H and the R is an alkyl or alkenyl having 10 to 20 carbon atoms. More preferably
19 the surfactant is selected from polyglyceryl-2 diisostearate or polyglyceryl-3 diisostearate

1 or mixtures and combinations of these. One of skill in the art should appreciate that the
2 oleaginous fluid may be selected from a variety of suitable fluids known in the art,
3 including diesel oil, mineral oil, synthetic oil, ester oils, glycerides of fatty acids,
4 aliphatic esters, aliphatic ethers, aliphatic acetals, or other such hydrocarbons and
5 combinations and mixtures of these and similar fluids. In a similar manner, the non-
6 oleaginous phase may be selected from a wide range of suitable fluids known in the art
7 including fresh water, sea water, brine, aqueous solutions containing water soluble
8 organic salts, water soluble alcohols or water soluble glycols or combinations and
9 mixtures of these and similar fluids. The weighting agent component of such an
10 illustrative drilling fluid can be either a water soluble weighting agent or a water
11 insoluble weighting agent or combinations and mixtures of these two. In one illustrative
12 embodiment, the water insoluble weighting agent is selected from barite, calcite, mullite,
13 gallena, manganese oxides, iron oxides, or combinations and mixtures of these and
14 similar solid materials used to weight drilling fluids. In another illustrative embodiment,
15 the water soluble weighting agent is selected from water soluble salts of zinc, iron,
16 barium, calcium or combinations and mixtures of these in aqueous solutions used to add
17 weight to drilling fluids.

18 It should further be appreciated that another illustrative embodiment of the present
19 invention includes an invert emulsion drilling fluid formulated to include: an oleaginous
20 continuous phase, a non-oleaginous discontinuous phase, a biodegradable surfactant
21 including a di-fatty acid ester of diglycerol, and a weighting agent. In such instances, the
22 fatty acid preferably has the formula RCO_2H in which R is an alkyl or alkenyl having 10
23 to 20 carbon atoms. More preferably the di-fatty acid ester of diglycerol is a
24 polyglyceryl-2 diisostearate.

25 Yet another illustrative embodiment of the present invention includes an invert
26 emulsion drilling fluid that includes: an oleaginous continuous phase, a non-oleaginous
27 discontinuous phase, a biodegradable surfactant including a di-fatty acid ester of
28 triglycerol in which the fatty acid has the formula RCO_2H and R is an alkyl or alkenyl
29 having 10 to 20 carbon atoms, and a weighting agent. It is preferred that the di-fatty acid
30 ester of triglycerol is polyglyceryl-3 diisostearate.

1 It will also be appreciated by one of ordinary skill in the art that a present
2 illustrative embodiment of the present invention includes a method of formulating an
3 invert emulsion drilling fluid so as to exhibit the characteristics of the above described
4 fluids. One such illustrative method, includes mixing an oleaginous fluid, a non-
5 oleaginous fluid, a biodegradable surfactant and a weighting agent to form an invert
6 emulsion. The biodegradable surfactant includes a fatty acid ester of diglycerol or
7 triglycerol in amounts sufficient to form an invert emulsion in which the oleaginous fluid
8 is the continuous phase and the non-oleaginous fluid is the discontinuous phase. In one
9 preferred illustrative embodiment the fatty acid ester is a di-fatty acid ester of diglycerol
10 in which fatty acid has the formula RCO_2H and R is an alkyl or alkenyl having 10 to 20
11 carbon atoms. In another preferred illustrative embodiment, a di-fatty acid ester of
12 triglycerol is utilized in which the fatty acid has the formula RCO_2H and R is an alkyl or
13 alkenyl having 10 to 20 carbon atoms. The oleaginous fluid is preferably selected from
14 diesel oil, mineral oil, synthetic oil, ester oils, glycerides of fatty acids, aliphatic esters,
15 aliphatic ethers, aliphatic acetals, or other such hydrocarbons and combinations and
16 mixtures of these and similar fluids. Similarly, the non-oleaginous phase is preferably
17 selected from fresh water, sea water, brine, aqueous solutions containing water soluble
18 organic salts, water soluble alcohols or water soluble glycols or combinations and
19 mixtures of these and similar fluids. In one preferred illustrative embodiment, the
20 weighting agent is either a water soluble weighting agent or a water insoluble weighting
21 agent or combinations and mixtures of the two. In such cases, the water insoluble
22 weighting agent is preferably barite, calcite, mullite, gallena, manganese oxides, iron
23 oxides, or combinations and mixtures of these and similar weight materials while the
24 water soluble weighting agent is preferably selected from water soluble salts of zinc, iron,
25 barium, calcium or combinations and mixtures of these and similar materials.

26 It should also be appreciated that the present invention encompasses a method of
27 drilling a subterranean hole with the invert emulsion drilling fluids as described above,
28 such an illustrative method includes: mixing an oleaginous fluid, a non-oleaginous fluid,
29 a biodegradable surfactant, and a weighting agent to form an invert emulsion, and drilling
30 said subterranean hole using said invert emulsion as the drilling fluid. It is preferred that

1 the biodegradable surfactant is a fatty acid ester of diglycerol or triglycerol that is present
2 in amounts sufficient to form an invert emulsion in which the oleaginous fluid is the
3 continuous phase and the non-oleaginous fluid is the discontinuous phase. In a more
4 preferred embodiment, the fatty acid ester of diglycerol or triglycerol is a di-fatty acid
5 ester of diglycerol in which the fatty acid has the formula RCO_2H and the R is an alkyl or
6 akenyl having 10 to 20 carbon atoms. Alternatively, the fatty acid ester of diglycerol or
7 triglycerol may be a di-fatty acid ester of triglycerol in which fatty acid has the formula
8 RCO_2H and the R is an alkyl or akenyl having 10 to 20 carbon atoms. As disclosed
9 above, the oleaginous fluid is preferably selected from diesel oil, mineral oil, synthetic
10 oil, ester oils, glycerides of fatty acids, aliphatic esters, aliphatic ethers, aliphatic acetals,
11 or other such hydrocarbons and combinations and mixtures of these and similar fluids.
12 The non-oleaginous phase is preferably selected from fresh water, sea water, brine,
13 aqueous solutions containing water soluble organic salts, water soluble alcohols or water
14 soluble glycols or combinations and mixtures of these and similar fluids. The weighting
15 agent can be a water-soluble weighting agent or a water insoluble weighting agent or
16 combinations of the two. Preferably the water insoluble weighting agent is selected from
17 barite, calcite, mullite, gallena, manganese oxides, iron oxides, or combinations and
18 mixtures of these and similar weighting agents. While the water soluble weighting agent
19 is selected from water soluble salts of zinc, iron, barium, calcium or combinations and
20 mixtures of these and similar weighting agents.

21 Also encompassed is a method of drilling a subterranean well with an invert
22 emulsion drilling fluid, said method comprising: mixing an oleaginous fluid, a non-
23 oleaginous fluid, a biodegradable surfactant, and a weighting agent to form an invert
24 emulsion, circulating said invert emulsion within said subterranean well and drilling said
25 subterranean well using said invert emulsion as the drilling fluid. In such an illustrative
26 embodiment, the biodegradable surfactant includes a fatty acid ester of diglycerol, in
27 which the fatty acid has the formula RCO_2H and R is an alkyl or akenyl having 10 to 20
28 carbon atoms. The biodegradable surfactant is in amounts sufficient to form an invert
29 emulsion in which the oleaginous fluid is the continuous phase and the non-oleaginous
30 fluid is the discontinuous phase. It is preferred that the fatty acid ester of diglycerol is a

1 di fatty acid ester and more preferably the fatty acid ester of diglycerol is polyglyceryl-2
2 diisostearate.

3 Another illustrative embodiment includes a method of drilling a subterranean well
4 with an invert emulsion drilling fluid, in which the method includes: mixing an
5 oleaginous fluid, a non-oleaginous fluid, a biodegradable surfactant, and a weighting
6 agent to form an invert emulsion, circulating said invert emulsion within said
7 subterranean well and drilling said subterranean well using said invert emulsion as the
8 drilling fluid. As part of the illustrative method, the biodegradable surfactant includes a
9 fatty acid ester of triglycerol having the formula RCO_2H in which the R is an alkyl or
10 akenyl having 10 to 20 carbon atoms. The biodegradable surfactant is in amounts
11 sufficient to form an invert emulsion in which the oleaginous fluid is the continuous
12 phase and the non-oleaginous fluid is the discontinuous phase. It is preferred that the
13 fatty acid ester of triglycerol is a di-fatty acid ester and more preferably the fatty acid
14 ester of triglycerol is polyglyceryl-3 diisostearate.

15 While the apparatus, compositions and methods of this invention have been
16 described in terms of preferred or illustrative embodiments, it will be apparent to those of
17 skill in the art that variations may be applied to the process described herein without
18 departing from the concept and scope of the invention. All such similar substitutes and
19 modifications apparent to those skilled in the art are deemed to be within the scope and
20 concept of the invention as it is set out in the following claims.
